

TESS Ceiling Panels

Description

TESS Ceiling Panels (Skylight) are created from original panoramic photographs taken by select award winning photographers. The original transparencies are enlarged and digitally processed onto Kodak's finest Duratransparency material and laminated to 1/8 inch Plexiglas to the exact size specifications of the Skylight configuration.

Standard panels are cut to fit into the client's fluorescent light boxes (4 – 40W or less cool-white fluorescent tubes recommended) or cut to fit within the appropriate grid work framing should facilities be using the TESS LED Light Boxes. The lamination process also includes special protective coatings that protect the image from UV deterioration, aging, yellowing and cracking.

The resulting panel is then inserted in the light box, replacing the existing diffuser panel. TESS Panels can also be set in custom-built skylight frames, with fluorescent lighting recessed 4-5 inches above the custom structure and art panels. Another option is to sit the image in the grid, place elevators above it and lay in the LED Light Boxes.

For installations of 4 or more standard (2' x 4') panels, TESS recommends the use of a dimmer system in sequence in order to provide adequate lighting control over the entire Skylight.

TESS Ceiling Panels carry a 12 year warranty against cracking, yellowing or fading under recommended lighting usage for the various products we offer.
